

DVS 5.0 released

Aquin Components released version 5.0 of its data management solution DVS. Next to new asset classes such as Credit Default Swaps and Swaptions, DVS 5.0 comes with an extended data model, new structures for user defined attributes as fund level user rights, transaction type groups, payment conditions, ratings and others. Furthermore functional enhancements of the DVS Function Editor and DVS Reporter have been implemented. Your account manager (sales@aquin.com) will be happy to provide you with additional information or detailed release notes.

With DVS 5.0, the Aquin data management team has once again demonstrated proximity to customer needs by rapidly and flexibly integrating new market requirements into the DVS release schedule. Many existing customers therefore stated that they will migrate to the new release in the first quarter already.

DVS is installed with renowned asset management customers such as Bank Julius Bär, Clariden Leu, Metzler Investment, Helaba Invest and others throughout Europe.

DVS is the strategic data hub purpose-built for investment companies and asset managers. DVS provides comprehensive, consistent and standardized investment information in a centralized quality-assured database. Multiple departments and systems can gain access to fund data from a single location through this data hub. DVS supports unified fund reporting, consolidation of fund information as well as historic fund information. Moreover, DVS serves as data hub for historic data while migrating to a new backoffice system. View our [report on Metzler Investment](#) on our [homepage](#) for a Xentis backoffice migration case study.
